

versiondog Job-Trigger

Trigger a versiondog job execution externally

Trigger a versiondog job execution automatically for a customized event e.g. a tool change on a machine

- Job trigger by external events
- Advanced scheduling
- Process optimization

What does it do?

- Triggers a job in versiondog via an external event, e.g via a button on an HMI
- Lets the machine decide when it needs a backup
- Enables you to initiate a backup automatically after a parameter change

What are the benefits?

- Seamlessly integrate it into your IT/OT environment
- Works with your existing OPC UA server
- save resources by reducing unnecessary job executions
- Optimizes your backup strategy with well-timed job executions
- Allows you to create a job sequence with your own tools
- Increases the quality of your data by executing your backups at the right moment
- Ensures that the backup is not performed during processing

Are there any requirements or costs?

- Active versiondog 8.0 (or later) server licence required
- Needs one versiondog job trigger licence per job
